Revolutionize photography

FOR RETAILERS

Every brand's images and product data. One open standard.

Open Brand Exchange (OBX) is a free, open standard for brands to deliver their final product images and article data to retailers. You connect a brand once and its content lands on your articles automatically. No emails, no WeTransfers, no separate portals.

Brand
publishes once

Your store
matched by EAN

An initiative by Photopilot · working name, in development

A problem every retailer knows

Every brand has its own portal

Ten brands means ten logins, ten ways to download and ten naming schemes.

Images arrive loose

Zips by email, links that expire, nothing tied to your EANs. Someone has to attach everything to the right articles by hand.

You don't see what changes

A brand replaces a packshot or withdraws an image. You only find out once it's already live.

Product data is missing

Material, care instructions and per-size EANs sit in another file, in another format, or nowhere at all.

How it works

1

Pick the brand

Find the brand in the list and request access in one click. The brand approves your request.

2

Matched automatically

Images and article data come in and are matched to your own articles by EAN, in the brand's order.

3

Always up to date

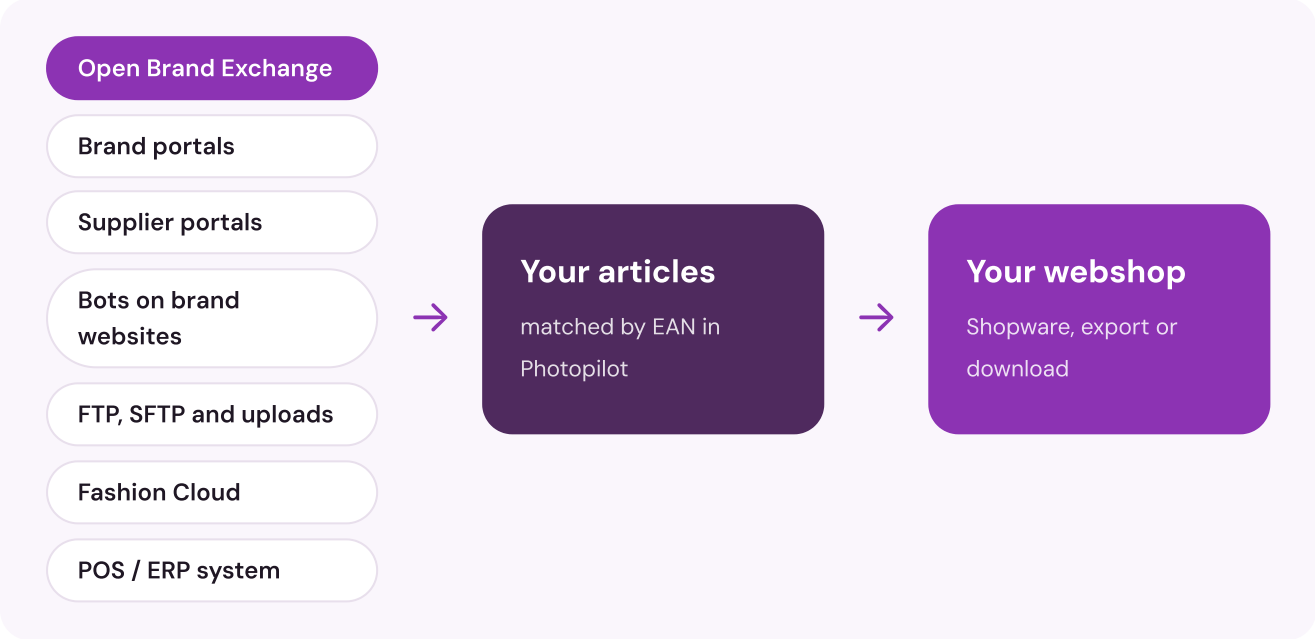

New or replaced images follow automatically. If the brand withdraws something, you see it and you decide what happens.

Pass this on to your brands

Publishing is free for brands: in Photopilot with their own brand portal (on their own domain too), or with the open-source server on their own hosting. Publish once, and every connected retailer is served.

Brand not connected yet? We fetch it anyway

An open standard is the clean route, but you don't wait for every brand to join. Photopilot already fetches images and product data from brands that aren't connected (yet), and everything lands on the same articles.

Supplier portals

Does the brand have a portal with a login? Photopilot learns once how it works and then fetches new images automatically, with your own credentials.

Bots for product data

Material, care instructions and dimensions from the brand's website or other sources you set up. On a schedule, respecting robots.txt. (beta)

Fashion Cloud

Is your brand on Fashion Cloud? Connect your account and Photopilot automatically fetches images (with view and order) and article data such as material and care, for every brand you have access to.

Supplier files

FTP, SFTP, a website or an upload: images are matched to the right article automatically by EAN or file name.

POS and ERP

Articles, sizes and EANs come from your own POS or ERP system, such as ACA, so everything lands on the right size and colour.

Something missing? AI fills the gap

No packshot, model shot or product text? Photopilot creates them for you, in your own webshop's style.

What you get

Final images

Only what the brand approved: packshots, model shots and details, in the brand's order.

Article data per size

Style number, colour, per-size EANs, season, target group, description, material and care instructions.

The formats you need

Original (if the brand allows it), web (2000 px) or square, with clean file names.

Usage rights included COMING

Channels, embargo date and expiry date travel with the image, so you never publish too early.

AI provenance preserved COMING

If an image was made or edited with AI, it says so, as the EU AI Act requires. That information isn't lost along the way.

Ready for the product passport COMING

Material and care fields line up with the upcoming EU Digital Product Passport for textiles.

Why open?

- **Free.** The standard costs nothing, for brands and for retailers.
- **No lock-in.** Brands can self-host with our open-source server or use Photopilot. For you it works the same either way.
- **Works with your own software.** Photopilot speaks it, a Shopware plugin is next, and any shop, PIM or ERP can build it in.

What works today, and what's coming

Today, in Photopilot LIVE

- Pick a brand from the list and request access in one click
- Images automatically matched to your articles by EAN
- Sign in to a brand portal: filter, paste an EAN list, download zip or CSV
- Material and care instructions in the article data
- Portals, bots and feeds for brands that haven't joined yet

With Open Brand Exchange COMING

- Every brand, including brands that aren't on Photopilot
- Shopware plugin: images straight into your webshop, even without Photopilot
- Usage rights, embargo and AI provenance per image
- Changes and withdrawals visible right away, article data in multiple languages

Frequently asked questions

What does it cost?

The standard is free. Signing in to a brand's portal and downloading costs you nothing. If you want images to land on your articles automatically and be edited further, you do that with a Photopilot account.

My brand isn't on it yet. Now what?

Then we fetch it anyway, through the brand's portal, bots or files. Also ask your contact at the brand to join: publishing is free for brands, through Photopilot or on their own server.

What software do I need?

Nothing to get started: the portal works in your browser. For automatic matching: Photopilot, and soon the Shopware plugin or any software that supports the standard.

What happens when a brand withdraws an image?

You see it right away. By default the image stays with you until you decide to replace or remove it.

Who owns the standard?

Photopilot starts and maintains it. The specification, test suite and server are published openly, and once several parties use it, a joint steering group takes over.

Be one of the first

We're looking for retailers who want to shape this from the start: which brands do you want to connect, and which shop or software do you use? Email us and we'll include you in the first version.
